Re: A Simple Tool to Track Store Performance Automatically

What I Built

This week I built a small tool that checks how well our stores are performing against their sales targets, and automatically flags which ones need attention. Instead of someone manually comparing numbers store by store, the tool does it instantly for every store on the list and prints a short summary for each one, labeled **Normal**, **Warning**, or **Critical** depending on how close they are to target.

Why This Matters (Context)

Right now, checking performance across multiple sites usually means pulling reports, doing the math by hand, and comparing them one at a time. That works fine for one or two stores, but it gets slow and error-prone as the number of locations grows, and problems can sit unnoticed for days before anyone spots them. Automating this check means every store gets reviewed the same way, every time, with no manual math involved.

Why It's Faster Than Manual Checks (Insight)

The tool reviews every store in seconds and immediately separates the ones that are fine from the ones that need a closer look, rather than someone scrolling through spreadsheets trying to catch what stands out. Because the rule for what counts as a problem is applied consistently, two stores with the same numbers will always get the same flag, removing the guesswork or inconsistency that can creep into manual reviews.

Recommended Next Step (Action)

I'd recommend piloting this with the regional sales team first, since it's already set up to compare store output against monthly targets. Once it's connected to our actual sales numbers (rather than the sample figures used for this week's exercise), it could run automatically each morning and send a short list of stores flagged "Warning" or "Critical" straight to the relevant area manager, so issues get attention the same day rather than at the end of the month.
